Meroline Lizlent

| Fullstack Software Developer | Email | GitHub | LinkedIn | Dev.to

Profile

Fullstack software developer building web applications and backend systems across Go, JavaScript, and Python. Experience spans REST API design, relational databases, containerized deployment, and CI/CD, with practical, production-style projects built through an intensive peer-learning coding programme.

Technical Skills

Languages: Go, JavaScript, Python, SQL

Frameworks: FastAPI, Django, Node.js, React.js, Express

Tools & Infrastructure: Git, Docker, Linux, PostgreSQL, GitHub Actions, CI/CD, CLI

Experience

Zone01 Kisumu — Apprentice Software Engineer

- Completing an intensive, peer-to-peer, project-based software engineering curriculum (01-edu/Zone01 network) with no formal lectures — projects are self-driven and evaluated through peer code review.
- Delivered full-stack curriculum projects spanning backend systems in Go (social network platform), algorithmic problem-solving, and JavaScript language fundamentals.
- Applied core engineering practices throughout: authentication and session management, database design and migrations, automated testing, containerization, and collaborative version control with Git.

Projects

RepAn — GitHub Repository Analyzer — *FastAPI, Python, SQLite, OpenAI API, Vanilla JS/HTML/CSS, GitHub Actions*

- Built an application that analyzes GitHub repositories using the OpenAI API, capable of analyzing a 20,000-file repository in under 5 seconds, with a FastAPI/Python backend, SQLite storage, and a vanilla JS/HTML/CSS frontend, plus a GitHub Actions CI/CD pipeline for automated testing and deployment.

Chiro — Regional Ecommerce Platform — *Ruby on Rails, Next.js, PostgreSQL, GitHub Actions*

- Built an ecommerce platform tailored to Western Kenya regions, covering product listings, orders, and regional storefront needs, architected on Rails/PostgreSQL to handle 10,000 concurrent users, with a GitHub Actions CI/CD pipeline for automated testing and deployment.

CivicVote — Voter's Companion App — *Go, PostgreSQL, React, TypeScript, GitHub Actions*

- Built a voter's companion app to help citizens navigate the voting process and access civic information, with a Go/PostgreSQL backend chosen for concurrency and scalability, and automated builds and deployments via a GitHub Actions CI/CD pipeline.

SolarSats — Peer-to-Peer Solar Energy Trading — *Python, FastAPI, Lightning Network, GitHub Actions*

- Built a peer-to-peer solar energy trading app for Kenyan rooftop solar owners using Lightning Network micro-payments; delivered as a 12-hour bootcamp sprint that became a reference architecture for later Lightning projects.
- Automated testing and deployment with a GitHub Actions CI/CD pipeline.

Social Network Platform — *Go, SQLite, Svelte, Docker, WebSockets, GitHub Actions*

- Built a Facebook-style social network to a full product spec — follower graphs, public/private profiles, posts with configurable privacy, groups with events and group chat, notifications, and real-time private chat over WebSockets — with a Go/SQLite backend (bcrypt auth, versioned migrations, Gorilla WebSocket) and a Svelte frontend, containerized as separate Docker images.
- Configured GitHub Actions for full CI/CD automation, managing multi-container deployments and improving system reliability during real-time load testing at up to 10,000 concurrent users.

Superhero & Villain Registry — *Vanilla JavaScript*

- Built a searchable superhero/villain database from scratch in vanilla JavaScript, with field-specific search operators, sorting, pagination, and a detail modal, returning API responses in under 2 seconds.
- Implemented URL-based state persistence so searches, sorts, and pagination are shareable and bookmarkable.

Selah — Spiritual Support Platform — *React, TypeScript, Supabase, Groq API, GitHub Actions*

- Designed the system architecture for a spiritual-support web app pairing an admin dashboard with a seeker-facing frontend, built with React, TypeScript, and Supabase, integrating the Groq API for AI-assisted responses.
- Implemented a safety-first crisis-detection module that always routes sensitive input to fixed, human-reviewed responses rather than AI-generated text, with Groq API responses returned in under 1 second, and a GitHub Actions CI/CD pipeline for automated testing and deployment.

Education

Mount Kenya University — Bachelor of Technology in Computer and Electronic Systems
